

# Benefits of Facelift Surgery

We show feeling through our facial expressions. Age can cause wrinkles and sullen features which can portray a tired, sad or angry version of ourselves which may not be how we truly feel. A facelift can reveal the true you.

## Jawline

The skin begins to loosen its elasticity with age. This can cause the jawline to lose definition. By reducing and tightening loose skin, a facelift helps to redefine the jawline. Underlying tissue and muscles are also contoured with the goal of a slimmer, more defined profile.

## Eyes

The most noticeable and prominent feature on our face are our eyes. Over time aging can cause the skin around your eyes to sag, making you look sad and tired even when you're not. The skin is not just tightened around the forehead, it is also tightened and smoothed around the eyes, allowing for a refreshed and energized look.

## Laugh Lines

The lines running from the corner of your nose to the corner of your mouth can become deep and very pronounced as you age. A facelift can lessen the appearance of these laugh lines by tightening the skin in your jowls and cheeks while removing fatty tissue. The underlying muscles are then contoured and tightening to reduce laugh lines.

## Other Signs of Aging

Between wrinkles, deep lines and excess skin, the face is one of the first parts of your body to show age. A facelift combats the visible signs of aging by helping to tighten skin that has lost its elasticity. In addition, the combination of removing excess skin and fat and contouring the underlying muscles helps leave the face looking firmer and appear more youthful.

Dr. Renato Saltz, is a board certified plastic and reconstructive surgeon in Utah. His expertise is in cosmetic surgery, specifically facial rejuvenation, body contouring, and breast surgery.
